(57) Abstract

Inhibitors of sex steroid activity, for example those having general structure (A) may be used as part of a pharmaceutical composition to provide antiestrogenic effects and/or to suppress estrogen synthesis. Such pharmaceutical compositions are useful for the treatment of breast cancer or other diseases whose progress is aided by activation of sex steroid receptors.

## **SEX STEROID ACTIVITY INHIBITORS**

### **BACKGROUND OF THE INVENTION**

This invention relates to novel inhibitors of sex steroid activity such as antiestrogen compounds having effective antagonistic capability while substantially lacking agonistic effects. More particularly, certain preferred embodiments of the invention relate to certain estradiol and diphenylethylene analogs which have high affinity for estrogen receptors but do not activate such receptors and/or which inhibit the production of sex steroids or their precursors.

During the treatment of certain sex steroid-dependent diseases, it is important to greatly reduce or, if possible, eliminate certain sex steroid-induced effects. For this purpose, it is desirable both to block receptor sites stimulated by sex steroids

- 2 -

and also to reduce the amount of sex steroid available to act at these sites. For example, alternative or concurrent therapy to administration of antiestrogens could involve attempts to block the production of estrogens (e.g. by ovariectomy) such that less is available to activate receptor sites. However, prior art methods for blocking estrogen production insufficiently inhibit estrogen-induced functions. Indeed, it is possible that even in the total absence of sex steroid, some receptors may be activated. See Simard and Labrie, "Keoxifene shows pure antiestrogenic activity in pituitary gonadotrophs", Mol. Cell. Endocrinol. 39: 141-144, (1985), especially page 144.

Hence, antagonists of sex steroids may produce greater therapeutic results than therapy which only inhibits sex steroid production. Prior art antagonists, however, often have insufficient affinity for receptors, and some, although capable of binding the receptors, may themselves act as agonists and undesirably activate the very receptors they are intended to shield from activation.

There is, therefore, a need in the art for antiestrogens which effectively block estrogen receptors with minimal or no agonistic effect. In Wakeling and Bowler, "Steroidal Pure Antioestrogens", J. Endocrinol. 112: R7-R10 (1987), a steroid derivative is said to act as an antiestrogen but to exhibit some estrogen activity. The net effectiveness of a compound is effected by both its agonistic (undesirable) and antagonistic (desirable) activities.

In U.S. Patent 4,094,994, it is disclosed that the use of certain antiestrogens may inhibit certain human breast tumor cells.

H. Mouridsen et al., Cancer Treatm. Rev. 5: 131-141 (1978), discloses that Tamoxifen, an antiestrogen, is effective in remission of advanced breast cancer in about 30 percent of the women patients treated.

The combined use of the antiestrogen Tamoxifen and a luteinizing hormone-releasing hormone agonist, Buserelin, is also known for treatment of breast cancer. See, for instance, Klijn et al. J. Steroid Biochem. 420: no. 6B, 1381 (1984). The objective remission of such cancers, however, remains unacceptably low.

It has been found that certain  $7\alpha$ -substituted derivatives of estradiol, for example a  $7\alpha$ -( $\text{CH}_2$ )<sub>10</sub>CONMeBu substitution possess antiestrogenic activity (Bowler et al., 1985; Eur. Patent Application 0138504; Wakeling and Bowler, J. Steroid Biochem. 30: 141-147 (1988). See also US patent 4,659,516. The substitution ( $\text{CH}_2$ )<sub>9</sub>SOC<sub>5</sub>H<sub>6</sub>F<sub>5</sub> has also been used on certain compounds (Wakeling et al., Cancer Res. 51: 3867-3873, 1991).

Certain -( $\text{CH}_2$ )<sub>10</sub>CONMeBu substituted compounds are also disclosed in US Patent 4,732,912 (See e.g. example 5 and 16). See also EP Pat. No. 166 509, EP Pat. No. 124 369, EP Pat. No. 160 508, EP Pat. No. 163 416, U.S. Pat. No. 4,760,061, U.S.

Pat. No. 4,751,240 and Wakeling A.E. and Bowler, J., J. Endocrinol. 112: R7-R10 (1987).

Estradiol derivatives bearing a carboxyalkyl substituent at the 7 $\alpha$ -position maintained their affinity for the estrogen receptor when linked via their carboxy group to agarose or polyacrylamide resin for affinity chromatography purification of the estrogen receptor (Bucourt et al., J. Biol. Chem. 253: 8221, 1978).

Some steroid derivatives, such as 16-methylene estradiol and 16-methylene estrone, have been described as inhibitors of 17 $\beta$ -hydroxysteroid dehydrogenase activity (Thomas et al., J. Biol. Chem. 258: 11500, 1983).

Certain nonsteroidal compounds which are stated to have antiandrogenic effect are described by Furr et al., J. Endocrinol. 113: R7-R9 (1987).

U.S. Pat. No. 4,659,695 relates to a method of treatment of prostate cancer for susceptible male animals including humans whose testicular hormonal secretions are blocked by surgical or chemical means, e.g., by use of an LHRH agonist, e.g., [D-Trp<sup>6</sup>, des-Gly-NH<sub>2</sub><sup>10</sup>]LHRH ethylamide. The treatment includes administering an antiandrogen, e.g., flutamide in association with at least one inhibitor of sex steroid biosynthesis, e.g., aminoglutethimide and/or ketoconazole. See also PCT/U.S. 85/01454 (International Publication Number

WO 86/01105) regarding combination therapy for treating hormonal-dependent cancers.

U.S. Pat. No. 4,472,382 relates to a method of treating prostate cancer using the combination of an antiandrogen and an LHRH agonist.

In U.S. Pat. No. 4,386,080 relates to new amide derivatives, and more particularly to novel acylanilides, possessing antiandrogenic properties.

In French Patent 2528434 and in Jordan and Koch, "Regulation of Prolactin Synthesis in vitro by estrogenic and antiestrogenic derivatives of estradiol and Estrone", Endocrinology 124(4): 1717-1725 (1989), antiestrogenic effects are described for certain 11 $\beta$ -substituted estradiol derivatives.

In U.S. Pat. No. 3,995,060, U.S. Pat. No. 4,161,540 and U.S. Pat. No. 4,139,638, it is disclosed that certain 4'-substituted and 3',-4'-disubstituted anilides have antiandrogenic properties.

For a number of years, researchers have attempted to develop compounds which can efficiently inhibit androgen and/or estrogen formation without causing adverse effects to healthy tissues. More particularly, the inhibition of 17 $\beta$ -hydroxysteroid dehydrogenase, which is involved in the biosynthesis of testosterone, androst-5-ene-3 $\beta$ ,17 $\beta$ -diol and estradiol, has been studied by some workers. Some affinity-label inhibitors for human placental estradiol

- 6 -

17 $\beta$ -dehydrogenase have been described (C.C. Chin and J.C. Warren, J. Biol. Chem. 250: 7682-7686, 1975; Y.M. Bhatnagar et al., J. Biol. Chem. 253: 811-815, 1978; C.C. Chin et al., J. Biol. Chem. 255: 3660-3664, 1980; J.L. Thomas and R.C. Strickler, J. Biol. Chem. 258: 1587-1590, 1983).

B. Tobias et al., J. Biol. Chem. 257: 2783-2786 (1982) and R.J. Auchus and D.F. Covey, Biochemistry 25: 7295-7300 (1986) disclose, respectively, the use of 17 $\beta$ -propynyl-substituted progestins and propynyl-substituted 3-hydroxy-14,15-secoestra-1,3,5(10)-trien-17-one as inhibitors of the 17 $\beta$ -estradiol dehydrogenase.

Thomas J.L. et al., J. Biol. Chem. 258: 11500 (1983) have described that 16-methylene estradiol and 16-methylene estrone are inhibitors of 17 $\beta$ -hydroxysteroid dehydrogenase activity.

Prior art methods have not been completely effective in inhibiting sex steroid synthesis while avoiding undesirable side effects.

As used herein, the term "sex steroid activity inhibitor" includes any compound which suppresses the activity of sex steroids by any mechanism including, for example, inhibition of sex steroid synthesis or antagonistic blocking of sex steroid receptors. "Androgen activity inhibitors" and "estrogen activity inhibitors" are sex steroid inhibitors capable of inhibiting the activity of androgens and estrogens, respectively. For example, estrogen activity inhibitors include, but are not limited to antiestrogens which block estrogen receptors, thereby making them unavailable to estrogen compounds which could otherwise activate those receptors. Sex steroid activity inhibitors also include compounds which inhibit the formation of compounds capable of activating sex steroid receptors such as inhibitors of the production of natural sex steroids (e.g. 17 $\beta$ -estradiol) or inhibitors of production of precursors of natural sex steroids. One mechanism by which these sex steroid production inhibitors may operate is by blocking enzymes which catalyze production of natural sex steroids or their precursors (e.g. inhibitors of enzymes such as aromatase, 17 $\beta$ -hydroxysteroid dehydrogenase, 3 $\beta$ -hydroxysteroid dehydrogenase and the like).

- 28 -

As used herein, the term "estrogenic nucleus" includes any compound which, in the absence of the side chain substituent specified herein, is capable of acting as an estrogen as determined by a weight increase of at least 100 percent over a seven-day period of the uterus of ovariectomized rats treated with the compound in question (0.5 mg twice daily per 100 grams of body weight) versus a control group of ovariectomized rats. Treatment should start on the day of castration. The precise test, other than any parameters set forth in this paragraph, is that reported in Simard et al., Mol. Endocrinol. 2: 775-784 (1988).

The following conventions apply to structural formulae set forth herein. Unless specifically designated to the contrary, substituents may have either  $\alpha$  or  $\beta$  stereochemistry or, where valence permits may represent one substituent in  $\alpha$  position and another in  $\beta$  position. Presence of optional pi bonds are independent of each other. All structures include salts thereof. Atoms of any estrogenic nucleus for which no substituent is shown or described may optionally be substituted or unsubstituted so long as such substitution does not prevent the nucleus from functioning as an "estrogenic nucleus" as defined herein. Those atoms having a defined substituent may optionally be further substituted by other substituents where their valence permits such further substitution. As used herein, the term "lower", when describing a chemical moiety means a moiety having 8 or fewer atoms. For instance, a "lower alkyl" means a C<sub>1</sub> to C<sub>8</sub> alkyl. Any moiety of more than two atoms may be straight- or branched-chain unless otherwise specified.

**BRIEF DESCRIPTION OF DRAWINGS**

Figure 1 illustrates a competition binding assay of the affinity of estradiol, diethylstilbestrol, ICI 164384 (Wakeling, A.E. and Bowler, J., 1987; J. Endocrinol. 112: R7-R110) and EM-142 (an antiestrogen having a nonsteroidal nucleus and synthesized in example 1, herein) for the rat uterine cytosol receptor (Asselin et al., 1978; J. Steroid Biochem. 9: 1079-1082).

Figure 2 illustrates the effect of the indicated doses of EM-142 injected twice daily (b.i.d.) on uterine weight (mg) in adult female ovariectomized Balb/C mice treated for 4.5 days in the presence or absence of simultaneous treatment with  $17\beta$ -estradiol (0.01  $\mu$ g, b.i.d.).

Figure 3 illustrates the effect of the administration of EM 139 on uterine weight (mg) in adult ovariectomized mice. The compound was administered twice daily (b.i.d.) at the indicated doses for 4.5 days in the presence or absence of  $17\beta$ -estradiol (0.01  $\mu$ g, b.i.d.) via the subcutaneous route.

Figure 4 is a graph illustrating that the antiestrogen which is the subject of Figure 3 is also a good inhibitor of sex steroid synthesis.

Figure 5 illustrates the comparative inhibitory activity of increasing concentration of EM 343 (--) and EM 312 (o-o) on the growth of human breast cancer ZR-75-1 cells stimulated by  $17\beta$ -estradiol. The respective IC<sub>50</sub> values are calculated at  $2.55 \times 10^{-10}$ M for EM 343 and  $8.43 \times 10^{-10}$ M for EM 312, thus indicating a 3-fold higher activity for EM 343.

The following compound of the invention:

was synthesized and tested for its ability to inhibit the growth of ZR-75-1 human breast cancer cell line. The results are reported in Figure 5 as further discussed below.

The synthesis is described in Scheme A (page 66 herein) and Scheme 33 (page 183 herein). The synthesis of the compound 23 is described in Scheme A, and the starting materials and reagents were purchased from Aldrich Chemical Company Inc. (Milwaukee, Wis). Thus, the acid chloride 1 (20.0g; 0.1mol) was added dropwise to methanol (60ml) at room temperature and with stirring. The solution was refluxed for 1h. The solvent was removed under reduced pressure and the resulting oil was dissolved in ethyl acetate. The organic solution was washed with saturated sodium bicarbonate aqueous solution. The organic solution was dried ( $\text{MgSO}_4$ ) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:9) to yield the compound 2 (Scheme A) (18.0g; 92%).

- 63 -

The above ester 2 (21.2g; 0.108mol) and the nitrile 3 (available from Aldrich Chemical Company Inc., Milwaukee, Wis.) (17.5ml; 0.129mol) were dissolved in benzene (750ml). The solution was refluxed and some benzene (100ml) was removed by means of a Dean Stark apparatus. The solution was left to cool down; then sodium ethoxide (9.2g; 0.135mol) was added. The resulting mixture was refluxed for 18h; it was washed with 1N hydrochloric acid aqueous solution. The organic solution was dried ( $MgSO_4$ ) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:4) to yield compound 4 (23g; 69%). ( $\delta$  NMR; 300MHz; solvent:  $CDCl_3$ ; standard: TMS) 3.78 (3H; s; OMe) 3.84 (3H; s; OMe) 3.95 (3H; s; OMe) 5.84 (1H; s; O=C-CH-CN) 6.43 (1H; d; J 2.5Hz; CH phenyl) 6.54 (1H; dd; J 2.5Hz and 8.5Hz; CH phenyl) 6.89 and 7.35 (2H; AB system; J 8.5Hz; CH phenyl) 7.79 (1H; d; J 8.5Hz; CH phenyl).

A solution of the ketone 4 (37.8g; 0.12mol) in acetic acid (400ml) and concentrated hydrochloric acid aqueous solution (200ml) was kept at 90°C for 3h. The reaction mixture was neutralized with concentrated sodium hydroxide aqueous solution and it was extracted with ethyl acetate. The organic extract was dried ( $MgSO_4$ ) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:9) to yield compounds 5 (17.0g; 49%) and 6 (6.6g; 20%).

**Triphenol 23**

To a mixture of the ketones 5 (17.0g; 59.4mmol) and 6 (6.6g; 24.3mmol) was added pyridine hydrochloride (90g). The mixture was heated at 220°C for 20min. 1N hydrochloric acid aqueous solution (250ml) was added and the resulting mixture was extracted several times with ethyl acetate. The organic extract was dried ( $\text{MgSO}_4$ ) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 3:7) to yield compound 23 (14.1g; 69%).

The continuation of the synthesis of EM 343 is described below with reference to Scheme 33 (page 183).

**Diether 24**

To a mixture of the triphenol 23 (14.1g; 57.8mmol) in 3,4-dihydro-2H-pyran (200ml) at 0°C and with vigorous stirring was carefully added *p*-toluenesulfonic acid monohydrate (2.0g). The reaction mixture was stirred at 0°C for a further 1h. Ether (300ml) was added and the solution was washed with 1N sodium hydroxide aqueous solution. The organic extract was dried ( $\text{MgSO}_4$ ) and the solvent was removed under reduced pressure. The residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:9) to yield compound 24 (23.4g; 98%). ( $\delta$  NMR; 300MHz; solvent:  $\text{CDCl}_3$ ; standard: TMS) compound 24 (23.4g; 98%). **Chroman-4-one 25 (R=H) and Chalcone 26 (R=H)**

To a mixture of the diether **24** (24.4g; 59.2mmol) and the aldehyde (OHCC<sub>6</sub>H<sub>4</sub>OH) (7.6g; 62.18mmol) in dry benzene (750ml) was added piperidine (500µl). The solution was refluxed for 48h and water was continuously removed by means of a Dean Stark apparatus. The solvent was removed under reduced pressure and the residue was purified by chromatography on silica gel (ethyl acetate: hexanes; 1:9) to yield compounds **25 (R=H)** (14.3g; 47%) and **26 (R=H)** (8.4g; 27%). The product, EM 343, was then prepared for efficacy testing using the ZR-75-1 human breast cancer cell line.

#### Maintenance of Stock Cell Cultures

ZR-75-1 cells (83rd passage) were obtained from the American Type Culture Collection (Rockville, MD) and routinely cultured in phenol-red free RPMI 1640 supplemented with 1 nM E<sub>2</sub>, 2 mM L-glutamine, 1 mM sodium pyruvate, 15 mM N-2-hydroxyethyl-piperazine-N'-2-ethanesulfonic acid, 100 IU penicillin/ml, 100 µg streptomycin/ml, and 10% (v/v) fetal bovine serum (Hyclone, Logan, UT) under a humidified atmosphere of 95% air, 5% CO<sub>2</sub>, at 37 °C. All media and medium supplements were purchased from Sigma. Cells were subcultured weekly by treatment with a pancreatic solution containing 0.02% EDTA (w/v). The cell cultures used for the experiments herein described were between passages 89 and 94.

### Measurements of Cell Proliferation

Cells in their logarithmic growth phase were harvested, briefly centrifuged, and resuspended in RPMI 1640. Cells were then plated in triplicate in LIMBRO 24-well plastic culture plates ( $2 \text{ cm}^2/\text{well}$ ). Since plating density influences the effect of hormones on ZR-75-1 cell growth, cells were plated at a density of  $1 \times 10^4$  cells/well. After 72 h, medium was replaced with fresh medium of identical composition containing, in addition, the concentrations of steroids and/or inhibitors (e.g. EM 312 or EM 343) indicated along the X-axis of Figure 5. Control cultures received the ethanol vehicle only. Cells were then allowed to grow at  $37^\circ\text{C}$  for 10 days with medium changes (of identical composition) every 2 days. In absence of inhibitors, in 0.1 nM estradiol ( $\text{E}_2$ )-containing medium, ZR-75-1 cells have doubling time of about 48 h.

After  $\text{E}_2$  and/or antiestrogen treatment, cells were harvested by addition of 0.5 ml of a pancreatin solution (Sigma) for 5-10 min at  $37^\circ\text{C}$  before addition of 0.5 ml of RPMI 1640 containing 5% dextran-coated charcoal-fetal bovine serum in order to block enzymatic action. Cell number (0.10-ml aliquot) was determined by measurement of DNA content as previously described (Simard et al., *Endocrinology* 126: 3223-3231, 1990).

As may be seen from Figure 5, EM 343 provided extensive cell growth inhibition at low concentration. Half-maximal effectiveness occurred at a

- 70 -

concentration of  $2.55 \times 10^{-10} M$ . Without intending to be bound by theory, it is believed that the B-ring alkyl substitution utilized in certain preferred embodiments of the invention (e.g. the methyl substitution of EM 343) enhances effectiveness relative to compounds lacking such a substitution. For example, another species of the invention.

Chem. 33: 3216-3222 and 3222-3229, 1990) to have antiestrogenic activity underperformed EM 343 in comparative testing in our laboratory on the growth of human ZR-75-1 breast cancer cells, the IC<sub>50</sub> value of EM-312 being 3-fold higher at  $8.43 \times 10^{-10} M$  (Fig. 5).

Set forth below are some flow charts description and illustration of a number of preferred synthesis schemes for certain preferred antiestrogens in accordance with the invention. The steps set forth below are set forth merely by way of example. Those of skill in the art will readily recognize alternative synthetic

pathways and variations capable of producing a variety of antiestrogens and other sex steroid activity inhibitors in accordance with the invention.

The IR spectra were taken on a Perkin-Elmer 1310 spectrophotometer. Proton NMR spectra were recorded on a Varian EM-160A (60 MHz, when specified) or a Varian XL-200 (MHz) instrument. The following abbreviations have been used: s, singlet; d, doublet; dd, doublet of doublet; t, triplet; q, quadruplet; and m, multiplet. Chemical shifts are reported in  $\delta$  values in ppm relative to tetramethylsilane (TMS) as internal standard. Mass spectra (MS) were obtained on a V.G. Micromass 16F machine. Thin-layer chromatography (TLC) was performed on 0.25 mm Kieselgel 60F254 plates (E. Merck, Darmstadt, FRG). For flash chromatography, Merck-Kieselgel 60 (230-400 mesh A.S.T.M.) was used. All solvents used in chromatography have been distilled. Unless otherwise noted, starting material and reactant were obtained commercially and were used as such or purified by standard means. N-butyl, N-methyl-12,13-Bis (4-hydroxyphenyl)-12-pentadecenoic amide

(EM-142, compound 5 with  $x=10$ )

The synthesis of this compound is described in the scheme I (infra) where  $x=10$ .

12,13-Bis (4-methoxyphenyl)-11-pentadecenol (3)

4'-methoxy-2-ethyl,2-(4-methoxyphenyl), acetophenone (2) (710 mg, 2.5 mmol, prepared from desoxyanisoin, ethyl bromide and LDA by a known method) in THF (10 ml) were added, under argon, to Grignard reagent prepared from 11-bromo-tetrahydropyranyl undecanol (6.6 g, 19.7 mmoles) and magnesium

- 75 -

(0.6 g, 24.7 mmoles) and THF (10 ml). The mixture was stirred for 18 hours, then acidified with 1N HCl and extracted three times with ether. The organic phase was washed with water (X3), dried over anhydrous magnesium sulfate, and evaporated under reduced pressure. The residue was chromatographed on Silica-gel (Kieselgel, 60F254, Merck, 0.063-0.200 mm, 100 g). Elution with a mixture of hexane-ethyl acetate (9:1 v/v) gave 12,13-Bis-(4-methoxyphenyl)-tetrahydropyranyl pentadecan-1,12-diol (991 mg, 76%) as a mixture of diastereoisomers; colorless oil, IR<sub>max</sub> (neat) 3480, 1600 cm<sup>-1</sup>; <sup>1</sup>H-NMR ( $\delta$ , CDCl<sub>3</sub>); 0.62 (3H, t, J= 7.3 Hz, CH<sub>2</sub>CH<sub>3</sub>), 2.73 (1H, 2d, J=9.7 Hz, -CHCH<sub>2</sub>CH<sub>3</sub>), 3.25-4.00 (4H, m, -CH<sub>2</sub>OCHOCH<sub>2</sub>-), 3.76 and 3.79 (6H, 2s, -OCH<sub>3</sub>), 4.57 (1H, t, J=1.1 Hz, -O<sub>2</sub>CH-CH<sub>2</sub>) and 6.71-7.30 (8H, m, H-Ar)ppm. MS m/e= 523 (M<sup>+</sup>-H<sub>2</sub>O).

The above diastereoisomers (920 mg, 1.8 mmol) dissolved in methanol (30 ml) and 5N HCl (5 ml) was refluxed for 1 hour, then collected, and extracted three times with ether. The organic layer was washed with water, dried over anhydrous magnesium sulfate, evaporated under reduced pressure to dryness and finally chromatographed on silica gel (Kieselgel, 60F254, 0.063-0.200 mm, Merck, 100 g). Elution was a mixture of hexane-ethyl acetate (7:3 v/v) gave 12,13-Bis(4-methoxyphenyl)-11-pentadecenol (3) (710 mg, 65% from compound 2), colorless oil, IR,  $\nu_{max}$  (neat), 3340, 1600, 1030 cm<sup>-1</sup>; UV  $\gamma_{max}$  (log  $\epsilon$ ) = 231 (4.27) nm; <sup>1</sup>H-NMR ( $\delta$ , CDCl<sub>3</sub>), 0.88 (3H, t, J = 7.3 Hz, -CH<sub>2</sub>CH<sub>3</sub>), 3.30 (1H, t, J= 9.7 Hz, -CH-CH<sub>2</sub>CH<sub>3</sub>), 3.63 (2H, t, J = 6.6 Hz, -CH<sub>2</sub>OH), 3.76 and 3.78 (6H, 2s, -OCH<sub>3</sub>),

5.51 (1H, t,  $J = 8.8$  Hz, 1 -C = CH-) and 6.63-7.10 8H, m, H-Ar) ppm; MS m/e = 438 (M<sup>+</sup>).

N-butyl, N-methyl,12,13-Bis (4-methoxyphenyl)-11-pentadecenoic amide (4)

To a cooled solution of alcohol 3 (710 mg, 1.56 mmol) in acetone (17 ml) was added Jones' reagent (8N-chromic acid solution, 0.77 ml). After 30 minutes, isopropanol (5 ml) was added and the mixture was poured in water and extracted three times with ethyl acetate. The organic layer was washed twice with brine, dried over magnesium sulfate and evaporated to dryness. The crude 12,13-Bis (4-methoxyphenyl)-11-pantadecenoic acid was used in the next step without purification. To its solution in anhydrous methylene chloride (4 ml) at -10°C was added, under stirring, triisobutylamine (470  $\mu$ l, 1.96 mmol) and isobutylchloroformate (280  $\mu$ l, 2.1 mmol). After 40 minutes, N-methylbutylamine (1.5 ml) was added and the mixture was stirred at room temperature during 1 hour. Methylene chloride (50 ml) was added. The organic solution was washed with 1N HCl, saturated sodium bicarbonate solution and water (3X), dried on magnesium sulfate and evaporated to dryness. The residue was purified by "Flash chromatography" on silica gel (Kieselgel 60, Merck, under 0.063mm, 50 g). Elution with a mixture of hexane-ethyl acetate (4:1 v/v) gave N-butyl, N-methyl-12,13-Bis

To the above dimethoxy amide **4** (117 mg, 0.22 mmol) in  $\text{CH}_2\text{Cl}_2$  (1 ml) at 0°C was added, under argon, 1.0 M borane tribromide (675  $\mu\text{l}$ ). The solution was stirred for 1 hour, then poured into water and extracted with ether (3x). The organic solution was washed with water, dried on magnesium sulfate, and evaporated to dryness. The residue was purified by "Flash chromatography" on silica gel (Kieselgel 60, Merck, under 0.063 mm, 30 g). Elution with mixture of hexane-ethyl acetate (4:1 v/v) gave N-butyl, N-methyl-12,13-Bis (4-hydroxyphenyl)-12-pentadecenoic amide (EM-142, compound 5 with  $x$  = 10) (34 mg, 31%), colorless oil, IR  $\nu_{\text{max}}$  (neat) 3300, 1600  $\text{cm}^{-1}$ ; UV  $\gamma_{\text{max}}$  (log  $\epsilon$ ) = 235 (4.25) nm;  $^1\text{H-NMR}$  ( $\delta$ ,  $\text{CDCl}_3$ ), 0.76 (3H, t,  $J$ = 7.3 Hz, - $\text{CH}_2\text{CH}_3$ ), 0.96 (3H, t,  $J$ = 7.3 Hz, N  $(\text{CH}_2)_3\text{CH}_3$ ), 2.05-2.20 (4H, m,  $\text{CH}_2\text{-C}=\text{C-CH}_2$ ), 2.35 (2H, t,  $J$ = 7.0 Hz,

#### EXAMPLE 2

##### EFFECTIVENESS OF ANTIESTROGEN SYNTHESIZED IN EXAMPLE 1

EM-142 from example 1 was tested by competition binding on the rat uterine cytosol estrogen receptor with [<sup>3</sup>H] estradiol according to Asselin et al. (1976) procedure. Fig. 1 shows the binding affinity of EM-142 compared with estradiol, diethylstilbestrol and ICI 164384 (Wakeling and Bowler, 1987). (incubation was performed at 25°C for 3 hours). It can be seen that EM-142 is only 3 times less potent than 17 $\beta$ -estradiol itself while being more potent than the antiestrogen ICI 164384.

The antiestrogenic activity of EM-142 was measured *in vivo* by inhibition of the estradiol-induced stimulation of uterine weight in adult female ovariectomized Balb/c mice (body weight = 19-20 g) sacrificed five days after ovariectomy. EM-142, and/or estradiol contained in ethanol were injected subcutaneously in the appropriate groups in a solution of 0.9% (w/v) sodium chloride and 1% (w/v) gelatin at different concentrations in 0.2 ml for EM-142, twice daily, starting on the day of ovariectomy for a total of 9 injections. Estradiol was injected at the dose of 0.01  $\mu$ g in 0.2 ml, twice daily, starting on the morning after ovariectomy for a total of 8 injections.

After sacrifice, the uteri were rapidly removed, freed from fat and connective tissue and weighted. Results shown in Fig. 2 are the means  $\pm$  SEM of groups of

- 81 -

9-10 mice. It can be seen that the very low dose of 0.3  $\mu$ g already has a significant inhibitory effect of an  $E_2$ -induced uterine growth and that a complete reversal of  $E_2$  effect is obtained at higher doses. A half-maximal inhibitory effect is in fact observed at approximately 3  $\mu$ g while, at the doses used, 20  $\mu$ g causes a complete reversal of estrogenic action. Note that EM-142 has no estrogenic effect on uterine weight, thus demonstrating its potent antiestrogenic activity.

19-nor-testosterone-acetate 3-enolacetate (2)

In an apparatus supplied with a drierite drying tube, a solution of 19-nor-testosterone (10) (100 g; 0.365 mole) in acetic anhydride (200 ml), pyridine (32 ml) and acetylchloride (320 ml) was heated at reflux under magnetic stirring, for 3 h and then concentrated to dryness under vacuum. The dry residue was triturated in absolute ethanol, filtered and washed with little portions of absolute ethanol. After drying, 19-nor-testosterone acetate 3-enolacetate was obtained as a white powder (121.4 g, yield 93%) mp. 176-177°C. The structure was confirmed by spectroscopic means.

17 $\beta$ -acetoxy-estra-4,6-dien-3-one (3)

To a cooled suspension of enolacetate (121 g; 0.337 mole) in a mixture of DMF (330 ml) and water (7.2 ml) at 0°C was added, under nitrogen, over a period of 1 h, N-bromosuccinimide (63 g). The resulting solution was stirred for an

additional 0.5 h at 0°C. Then lithium carbonate (60.8 g) and lithium bromide (30.4 g) were added. The mixture was heated at 95°C for 3 h and then poured into 1.7 l of ice-cold water containing 165 ml of glacial acetic acid. After stirring during 15 hours, the crude 17 $\beta$ -acetoxy-estra-4,6-dien-3-one (3) was filtered, washed with water, dried in a desiccating apparatus and recrystallized twice from isopropyl ether (72 g, yield 68%, mp 110°C). The structure was confirmed by spectroscopic means.

7 $\alpha$ -(11'-acetoxy-undecyl) 17 $\beta$ -acetoxy estra-4-en-3-one (4)

A. Preparation of reagents and solvents

**11-bromo undecanol tetrahydro pyranyl ether**

11-bromo-undecanol (100 g, 398 mmol) was dissolved in dry ether (768 ml) and the solution was cooled to 0°C using an ice/H<sub>2</sub>O bath. To this solution was added HCl gas (2.13 g, 58.4 mmol, 26 ml of HCl/ether).

To this mixture, a solution of 3,4-dihydro-2H-pyran (39.9 g, 43.3 ml) freshly distilled in dry ether (218 ml) was added over a period of 90 min. The solution was then stirred over a period of 16 hours at room temperature. Afterwards,

- 90 -

sodium bicarbonate was added to the mixture. The residue was filtered and the solvent was evaporated under vacuum.

The product was then filtered through basic alumina (250 g, Woelm, grade II) using petroleum ether (30-60) as solvent (112 g, 81%).

B. Grignard reagent

In a dry three-neck flask (1000 ml) under dry argon, magnesium (12.0 g, 494 mmol) was placed and activated with iodine. Magnesium was heated with the flame to remove iodine and to dry the apparatus. The system was then cooled to -20°C, and a solution of 11-bromo-undecanol tetrahydropyranyl ether (73.8 g, 211 mmol) in dry THF (420 ml) was added dropwise. The mixture was stirred under dry argon during one day at -20°C.

The mixture was cooled to -35°C ( $\pm 2^\circ\text{C}$ ) using a dry ice/CCl<sub>4</sub>/acetone bath. The anhydrous cuprous chloride (1.18 g, 12 mmol) was added and the mixture was stirred over a period of 0.5h.

- 91 -

C. Addition of Grignard reagent

After 0.5 h, using the same apparatus mentioned above (Ar, -35°C), a solution of 17 $\beta$ -acetoxy estra-4,6-diene-3-one (3) (32.0 g, 102 mmol) in dry THF (300 ml) was added dropwise over a period of 6 h to the Grignard reagent (red coloration appeared and disappeared). The mixture was stirred for an additional 1 h and, after removal the cooling bath, acidified (about 0°C) with acetic acid (40 ml), diluted with water and extracted with ether (3x). The ether solution was washed with a saturated sodium bicarbonate solution and water. The organic layer was dried over anhydrous magnesium sulfate and evaporated under reduced pressure to dryness.

The residue was dissolved in MeOH (660 ml) and 5N HCl (180 ml), refluxed for 1 h and 45 min, then concentrated under reduced pressure and cooled in an ice bath. The mixture was then filtered to remove the white precipitate. After the solution had been diluted with water and extracted with methylene chloride (3x), the organic layer was dried over anhydrous MgSO<sub>4</sub> and evaporated under reduced pressure to dryness. Finally, the product (55.9 g, brown oil) was chromatographed on silica gel (Kieselgel 60F254, Merck, 0.063-0.200 mm, 1500 g). Elution with mixtures of methylene chloride and ethyl acetate (4:1 to 1:2 v/v) and then pure ethyl acetate gave crude 7 $\alpha$ -(11'-hydroxy-undecyl)-17 $\beta$ -hydroxy estra-4-en-3-one (34.8 g) which was dissolved in dry pyridine (200 ml) and dry

- 92 -

acetic anhydride (200 ml), stirred 17h at room temperature and then poured in ice-water. The product was extracted with methylene chloride (3X), washed with 1N hydrochloric acid, water, saturated sodium bicarbonate and water (3X), dried on anhydrous magnesium sulfate and filtered. After evaporation of solvent, the mixture (35 g) of  $7\alpha$ - and  $7\beta$ -diacetoxyenones and degradation products of Grignard reagent were separated by flash chromatography on silica gel (Kieselgel 60, Merck, 230 mesh ASTM, 2.0 kg) developed with a mixture of hexane and diethyl ether (2:3 v/v). The first product eluted was pure amorphous  $7\alpha$ -(11'-acetoxy undecyl)  $17\beta$ -acetoxy-*esta*-4-en-3-one (4) (20.8 g, 39.4 mmol, yield from dienone was 39.0%). Further elution gave the  $7\beta$ -isomer (5) (5.4 g, 10.3 mmol, 10%). All structures were determined by spectroscopic means.

$7\alpha$ -(11'-hydroxy-undecyl) *esta*-1,3,5(10)-trien-3,17 $\beta$ -diol (6a)

Under dry argon, a solution of  $7\alpha$ -(11'-acetoxy undecyl)  $17\beta$ -acetoxy-*esta*-4-en-3-one (4) (17.0 g, 32.4 mmol) in dry acetonitrile (150 ml) was added rapidly to a suspension of cupric bromide (14.8 g, 66.2 mmol) and mmol) and lithium bromide (2.89 g, 33.6 mmol) in warm acetonitrile (75 ml). The mixture was heated to reflux over a period of 30 min and stirred vigorously, and then cooled to room temperature. A saturated aqueous solution of sodium bicarbonate (50 ml) was added, and then the organic

compound was extracted with ethyl acetate (3x 150 ml). The organic layers were washed with water, dried over anhydrous magnesium sulfate, filtered and evaporated under vacuum to dryness. The residue was chromatographed on silica gel (Kieselgel 60F254 Merck 0.063-0.200 mm; 1000 g). Elution with hexane-ethyl acetate (1:1 v/v) gave the  $7\alpha$ -(11'-acetoxy-undecyl) estra-1',3',5'(10')-trien-3,17 $\beta$ -diol, 17 $\beta$ -acetate (6b) (8.51 g; 50.3%) and the starting product (1.33 g; 15%).

The above diacetate phenol (8.51 g, 16.2 mmol) was dissolved in methanol (90 ml) and sodium hydroxyde 30% (w/v) (9 ml). The mixture was refluxed for 90 min under dry nitrogen. The solution was then concentrated under vacuum and diluted with hydrochloric acid (10%, v/v). The mixture was extracted using ethyl acetate (4 x 150 ml) and the ethyl acetate extract was washed with water, dried over anhydrous magnesium sulfate, filtered and evaporated under vacuum. The evaporation gave  $7\alpha$ -(11'-hydroxy undecyl) estra-1,3,5(10)-trien-3,17 $\beta$ -diol (6a) (6.99 g, 98% brut) as a yellow foam, the structure of which was confirmed by spectroscopic means.

3-benzoyloxy  $7\alpha$ -(11'-hydroxy undecyl) estra-1,3,5(10)-trien-17 $\beta$ -ol (7)

The above triol (6.99 g; 15.8 mol) was dissolved in acetone (25 ml) and an aqueous solution of sodium hydroxyde (1N, 19.1 ml). The mixture was cooled

to 0°C using an ice/water bath. Benzoyl chloride (2.22 ml, 19.1 mmol) was then added dropwise. The mixture was stirred for 40 min at 0°C and then diluted with water. The solution was extracted using ethyl acetate (3X) and the organic layers were washed with a saturated aqueous solution of sodium bicarbonate and finally with water. The ethyl acetate solution was dried over anhydrous magnesium sulfate, filtered and evaporated under vacuum to dryness. Then, the residue was immediately chromatographed on silica gel (Kieselgel, 60F254, 0.063-0.200 mm; 500 g). The chromatography was carried out, first, using methylene chloride as solvent (about 1 liter) and secondly the pure 3-benzyloxy-7 $\alpha$ -(11'-hydroxy undecyl) estra-1,3,5(10)-trien-17 $\beta$ -ol (7), colorless oil (6.50 g, 75%) was eluted with methylene chloride-ethyl acetate (5:1 about 1 liter and 4:1; v/v). The structure was confirmed by spectroscopic means.

To a cooled solution of 3-benzyloxy-7 $\alpha$ -(11'-hydroxy undecyl) estra-1,3,5(10)-trien-17 $\beta$ -ol (7) (4.3 g) in acetone (100 ml) was added dropwise Jone's reagent (8N-chromic acid solution, 6.7 ml). After 30 min, isopropanol (40 ml) was added and the mixture was concentrated under vacuo. Water was added and the mixture was extracted four times with ethyl acetate. The organic layers were washed twice with brine, dried over magnesium sulfate and evaporated to

**EFFICACY OF AN ANTIESTROGEN SYNTHESIZED IN ACCORDANCE WITH EXAMPLE 9**

Compound "EM 139" shown in Scheme 9 above is an estrogen activity inhibitor. "EM 139" has been tested both for efficacy in acting as an antiestrogen by blocking estrogen receptors without substantially activating those receptors (see Figure 3), and for efficacy in inhibiting 17 $\beta$ -hydroxysteroid dehydrogenase (see Figure 4), an enzyme which catalyzes reactions involved in the synthesis of both androgens and estrogen (hereinafter referred to as "17 $\beta$ -HSD")

The antiestrogenic activity of "EM 139" was measured as its ability to inhibit the estradiol-induced stimulation of uterine weight in adult female ovariectomized Balb/c mice (body weight=19-20 g) sacrificed five days after ovariectomy. "EM 139", and/or estradiol dissolved in ethanol were injected subcutaneously in the appropriate groups in a solution of 0.9% (w/v) sodium chloride and 1% (w/v) gelatin at different concentrations of "EM 139" (as noted along the X axis of Figure 3). A dosage of 0.2 ml of the foregoing preparation, was administered twice daily, starting on the day of ovariectomy for a total of 9 injections. Estradiol was injected at the dose of 0.01  $\mu$ g in 0.2 ml, twice daily, starting on the morning after ovariectomy for a total of 8 injections.

After sacrifice, the uteri were rapidly removed, freed from fat and connective tissue and weighed. Results shown in Figure 3 are the means  $\pm$  SEM of groups

- 110 -

of 9-10 mice. As may be seen from Figure 3, EM 139 was highly effective in reducing estradiol-induced uterine weight gain.

To test the effect of "EM 139" on the inhibition of sex steroid formation, its effect on the  $17\beta$ -hydroxysteroid dehydrogenase catalyzed conversion of estradiol to estrone was observed. The reaction was followed by monitoring formation of NADH (at 340 nm). The rate of conversion of cofactor NAD to NADH varies directly with the rate of estradiol conversion to estrone. The ability of "EM 139" to inhibit estrone production is indicative of its ability to inhibit the estrogen-forming reverse reaction because both reactions are catalyzed by  $17\beta$ -hydroxysteroid dehydrogenase (Thomas et al., J. Biol. Chem. 258: 11500-11504, 1983).  $17\beta$ -hydroxysteroid dehydrogenase ( $17\beta$ -HSD) was purified to homogeneity from human placenta. A reaction vessel was prepared containing 1  $\mu$ g  $17\beta$ -HSD, 5 mM NAD, 20  $\mu$ M  $17\beta$ -estradiol, and the concentrations of the test compound "EM 139" which are indicated along the X-axis of Figure 4 in 1.0 ml of a mixture of Tris-HCl (50 mM), EDTA (2 mM),  $\text{NaN}_3$  (5 mM). The pH was 7.5. The reaction was allowed to proceed at 25°C for 15 min. Formation of NADH was measured at 340 nm. As shown by Figure 4, increasing concentrations of EM 139 significantly inhibited the reaction.

A mixture of N-n-butyl, N-methyl-11-(3'-benzoyloxy-17'-oxo estra-1',3',5'-(10')-trien-7'- $\alpha$ -yl) undecanamide (9a) (3.63 g), ethylene glycol (215 ml), p-toluenesulfonic acid (530 mg) and anhydrous benzene (250 ml) was refluxed with a Dean-Stark apparatus during 24 h. After cooling, the mixture was poured in water and extracted three times with ether. The organic layer was washed with a saturated sodium bicarbonate solution, and brine (3x), dried on magnesium sulfate and evaporated to dryness. After stirring during 1.5 h at 0°C, sodium iodide (300 mg) was added and the solution was stirred for 25 min. Afterwards, a solution of sodium thiosulfate (10%, v/v, 10 ml) and pyridine (0.5 ml) was added and the mixture was stirred for an additional 4 h and then poured into water and extracted three times with ether. The organic layers were washed with 1N hydrochloric acid, water, saturated bicarbonate solution and water (3x), dried on magnesium sulfate and evaporated to dryness. **GENERAL PROCEDURE FOR HYDROLYSIS OF ESTER FOLLOWING BY AMIDE FORMATION**

At a solution of ester (0.14-0.49 mmol) in MeOH (12-50 ml) was added aqueous solution of KOH 10% w/v (6-25 ml) and mixture was refluxed under argon atmosphere for 24 h. Thereafter, water was added and MeOH was evaporated under reduced pressure. The resulting solution was acidified with HCl and extracted with ethylacetate. Organic phase was washed with water, brine and dried over MgSO<sub>4</sub>. Without purification, the crude carboxylic acid (IR acid band at 1700 and 2400-3600 cm<sup>-1</sup>) was dissolved in dry CH<sub>2</sub>Cl<sub>2</sub> (20-70 ml) and tributylamine (0.58-2.04 mmol). The mixture was cooled at -10°C, isobutyl chloroformate (0.68-2.41 mmol) was added and allowed to react 30 min. At this time, N-methylbutylamine in excess (4.2-16.0 mmol) was added and the cooling bath was removed. After 2 h, CH<sub>2</sub>Cl<sub>2</sub> was added and organic phase was washed with HCl (1N) and dried over MgSO<sub>4</sub>. The solvent was removed and crude amide purified by column chromatography (hexane-ethylacetate/7:3, v/v).

#### HYDROLYSIS OF CARBONATE

Hydrolysis of carbonate compounds 32-35 was performed as follows: carbonate derivatives were dissolved in methanol (10 ml).  $K_2CO_3$  (1%; p/v) in aqueous methanol (25:75, v/v) (10 ml) was added and the resulting solution was stirred at room temperature for 3 h. Reaction mixture was acidified with HCl (1N) and MeOH was evaporated under vacuum. The residue was extracted with ethyl acetate and organic phase was dried, evaporated and purified by column chromatography (hexane-ethyl acetate 6.5:3.5, v/v).

Without intending to be bound by theory, it is believed that diphenyl ethylene and diphenyl ethenylene nuclei discussed herein contribute an enhanced affinity for the estrogen receptor. The ethenylene version with the optional double bond present is preferred, as is a closed third ring which includes, in its sides the ethenyl double bond and one side of one of the phenyl groups. The closed third ring is exemplified by the "B" ring, for example, of formulas XX and XXI below:

Preferred side chains, which are believed to help provide antagonistic or inhibitory characteristics, include the  $R^1[B-R^2]$  L-G and  $A'[Y-A'']_uXR_{21}$  side

chains discussed and defined above. Preferred additional substituents to the nucleus are those whose presence facilitates synthesis or enhances stability of the compound, or its metabolic half-life without significantly retarding affinity for the receptor. Smaller substituents such as C<sub>1</sub>-C<sub>2</sub> alkyl or alkylene groups or halogens may be used.

The R<sup>6</sup> substituent of formula XX (the G<sup>3</sup> substituent of formula XXI) is preferably either hydrogen or a C<sub>1</sub>-C<sub>3</sub> hydrocarbon such as methyl, ethyl or propyl. Generally, this substitution location (e.g. the atom receiving R<sup>6</sup> of formula XX or G<sup>3</sup> of formula XXI) is the atom which is both (A) one atom away from the A-ring and (B) one of the two atoms which receives the optional double bond when it is present. In contrast, the preferred side chain (e.g. R<sup>1</sup>(B-R<sup>2</sup>)LG of formula XX and R<sup>100</sup>LG<sup>1</sup>G<sup>2</sup> of formula XXI) is preferably substituted, as shown in formulas XX and XXI, at the atom which is both (A) one atom away from the optional pi bond and (B) one atom away from Z. It is believed that a lower hydrocarbon substitution at the R<sup>6</sup> position of formula XX (the corresponding G<sup>3</sup> of formula XXI or the R<sup>6</sup> position of formula I) substantially enhances the effectiveness of an inhibitor.

While both the A and D rings may be unsubstituted, certain embodiments include hydroxy substitution on one or both of the A and D rings (especially at the 3 and/or 12 positions of formula XXI or the 3 and/or 10 positions of formula XX). Other preferred substituents to the A and D rings include

would be converted to hydroxy *in vivo* after the pharmaceutical is administered to a patient. Such substituents include, for example, methoxy, ethoxy or esters.

Set forth below are several preferred compounds for use in the pharmaceutical composition of the invention corresponding to the structure:

$\beta$ -methoxytetralone 1 (0.254 g, 1.4 mmol in 5 ml of THF) was added to a refluxed mixture of  $(\text{MeO})_2\text{CO}$  (2.8 mmol) and sodium hydride (38 mg) in THF (20 ml). The mixture was heated at reflux during the night, cooled, water (25 ml) was added and neutralized with 5% HCL and extracted with ether. The ether was washed with a cooled saturated sodium bicarbonate and water. The organic phase was dried with anhydrous  $\text{MgSO}_4$  and the solvent was removed under reduced pressure. The residue in THF (5 ml) was added to a mixture of sodium hydride (21 mg, .85 mmol) and  $\text{R}_c\text{I}$  ( $\text{CH}_3\text{I}$ , .85 mmol) in THF (15 ml) and HMPA (1.7 mmol). The mixture was stirred during the night, water (25 ml) was added and neutralized with 5% HCL and extracted with ether. The ether was washed with a cooled saturated sodium bicarbonate and water. The organic phase was dried with anhydrous  $\text{MgSO}_4$  and the solvent was removed under reduced pressure and the compound 2 ( $\text{R}_c=\text{CH}_3$ ) was obtained in the yield of 80 %. The action of  $\text{MeOCOCN}$  (0.1 ml, 10 min at  $-78^\circ\text{C}$ ) on the compound 2 ( $\text{R}_c=\text{CH}_3$ ) (200 mg in 5 ml THF) in presence of LDA (lithium diisopropyl amine prepared from 0.13 ml diisopropyl amine and 1.6 M butyl lithium (0.6 ml) at  $-25^\circ\text{C}$ , 30 min) and HMPA (0.15 ml) yield in 83% the compound 3 ( $\text{R}_c=\text{CH}_3$ ). To this compound (290 mg) in THF (20 ml) was added 35% potassium hydride (119 mg, 0.72 mmol) 18-crown-6 (24 mg, 0.06 mmol) and the mixture stirred 8 h at  $25^\circ\text{C}$  and then  $\text{I}(\text{CH}_2)_8\text{OTBDMS}$  (657 mg, 1.9 mmol) was added and the mixture heated at reflux 6h. The extraction with ethyl acetate yield the compound 4 ( $n=8$ ,  $\text{R}_c=\text{CH}_3$ ) (98%). The decarboalkoxylation with lithium bromide in pyridine yield the compound 5 ( $n=8$ ,  $\text{R}_c=\text{CH}_3$ ) which was treated by

the Grignard's reagent of 3-bromo-anisole followed by acidic treatment. The resulting compound 6 ( $n=8$ ,  $R_c=CH_3$ ) was converted into amide 7 ( $n=8$ ,  $R_a=CH_3$ ,  $R_b=C_4H_9$ ,  $R_c=CH_3$ ) Thus a cooled solution compound 6 ( $n=8$ ,  $R_c=CH_3$ ) (700 mg) in acetone (17 ml) was added Jones' reagent (8N-chromic acid solution, 0.77 ml). After 30 minutes, isopropanol (5 ml) was added and the mixture was poured in water and extracted three times with ethyl acetate. The organic layer was washed twice with brine, dried over magnesium sulfate and evaporated to dryness. The crude acid was used in the next step without purification. To its solution in anhydrous methylene chloride (4 ml) at  $-10^{\circ}C$  was added, under stirring, triisobutylamine (470  $\mu$ l, 1.96 mmol) and isobutylchloroformate (280  $\mu$ l, 2.1 mmol). After 40 minutes, N-methylbutylamine (1.5 ml) was added and the mixture was stirred at room temperature during 1 hour. Methylene chloride (50 ml) was added. The organic solution was washed with 1N HCl, saturated sodium bicarbonate solution and water (3X), dried on magnesium sulfate and evaporated to dryness. The residue was purified by "Flash chromatography" on silica gel (Kieselgel 60, Merck, under 0.063mm, 50 g). Elution with a mixture of hexane-ethyl acetate gave the amide 7 ( $n=8$ ,  $R_a=CH_3$ ,  $R_b=C_4H_9$ ,  $R_c=CH_3$ ) (63%). The removal of the protection into compound 8 (EM 736,  $n=7$ ,  $R_a=CH_3$ ,  $R_b=C_4H_9$ ,  $R_c=CH_3$ ) is performed with pyridine-HCl.

## EXAMPLE 40

Scheme 35

4'-hydroxy-2-(4-benzoyloxyphenyl) acetophenone 35 prepared from the commercial desoxyanisoïn (250 g)(hydrolysis of the methoxyl group with pyridine-HCl at 220 °C followed by the treatment with 120 ml of benzoyl chloride and 20g of dimethylaminopyridine in 2l of methylene chloride during 24h) is bromined as usual manner with bromine in acetic acid at room temperature and the residue was without purification treated overnight with dihydropyran (150 ml) and p-toluenesulfonic acid (10 g) in 2l of methylene chloride at 0 °C. The bromo-compound 36 is isolated (170 g) after flash chromatography on silica gel in using ethyl acetate /hexane mixture containing 0.1% triethylamine. This compound is treated for 10 min at room temperature with sodium methylate in methanol followed with 2-mercaptophenyl triphenyl phosphonium salt 37 (obtained from reduced commercial thiosalicylic acid and triphenyl phosphine). The resulting mixture was heated at reflux for 3 h with sodium methylate in methanol and the compound 38 (95 g) is isolated after ether extraction and flash chromatography on silica gel with ethyl acetate /hexane mixture containing 0.1% triethylamine. The benzyl protection is hydrolysed with sodium carbonate in methanol-water solution at room temperature and a mixture of resulting compound, N,N, diethyl chloroethylamine HCl and cesium carbonate in N,N-dimethylformamide (20 ml) is kept at 90°C and with stirring for 12h, extracted several times with ether. Drying ( $MgSO_4$ ) and removal of solvent under reduced pressure gives a gummy residue that is purified by chromatography on silica gel (hexanes: ethyl acetate; 1:1). The resulting compound in methanol (2 l) is heated at reflux with

p-toluenesulfonic acid (5 g) for 3 h. Extraction with ethyl acetate and flash chromatography with silica gel (hexanes: ethyl acetate) gives the compound 39 (EM 547) (68 g) of which structure was determined by spectroscopic means.

(54) Title: SEX STEROID ACTIVITY INHIBITORS

(57) Abstract

Inhibitors of sex steroid activity, for example those having general structure (A) may be used as part of a pharmaceutical composition to provide antiestrogenic effects and/or to suppress estrogen synthesis. Such pharmaceutical compositions are useful for the treatment of breast cancer or other diseases whose progress is aided by activation of sex steroid receptors.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/CA92/00518

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
  
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  

In view of the large number of compounds which are defined by the general formulas of claims 1,7,20,23,30,64-65,70,78,84,89,97-99 the search was limited to the inventive part of the molecules and to the compounds mentioned in the examples. (PCT Art.6,Guidelines Part B, Chapt.II.7 last sentence,
3.  Claims Nos.: *2nd chapt. II 3f.* because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

For further information see Form PCT/ISA/206 sent 03/06/93.

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
  
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:  

please see annex.
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.
